

Prop borel cantelli iii

Proposición 1 (de Borel-Cantelli III). Sea $(A_n)_{n \in \mathbb{N}}$ una sucesión de sucesos independientes dos a dos tal que $\sum_{n=1}^{\infty} \mathbb{P}(A_n) = \infty$

$$\implies \frac{\sum_{j=1}^n \mathbb{1}_{A_j}}{\sum_{j=1}^n \mathbb{P}(A_j)} \xrightarrow[n \rightarrow \infty]{c.s.} 1.$$

Demostración: Denotamos $S_N := \sum_{j=1}^N \mathbb{1}_{A_j}$, entonces por la independencia dos a dos

$$\mathbb{V}(S_n) = \sum_{j=1}^n \mathbb{V}(\mathbb{1}_{A_j}) \leq \sum_{j=1}^n \mathbb{P}(A_j). \quad (1)$$

Por otro lado, $\mathbb{V}(\mathbb{1}_{A_j}) = \mathbb{E}[\mathbb{1}_{A_j}^2] - \mathbb{E}^2[\mathbb{1}_{A_j}] \leq \mathbb{E}[\mathbb{1}_{A_j}^2] = \mathbb{E}[\mathbb{1}_{A_j}]$. Sea $\varepsilon > 0$, por la

$$\begin{aligned} \mathbb{P}\left(\left|\frac{\sum_{j=1}^n \mathbb{1}_{A_j}}{\sum_{j=1}^n \mathbb{P}(A_j)} - 1\right| > \varepsilon\right) &= \mathbb{P}\left(\left|\sum_{j=1}^n \mathbb{1}_{A_j} - \sum_{j=1}^n \mathbb{P}(A_j)\right| > \varepsilon \sum_{j=1}^n \mathbb{P}(A_j)\right) \\ &\stackrel{\text{Chebyshev}}{\leq} \frac{1}{\varepsilon^2 \left(\sum_{j=1}^n \mathbb{P}(A_j)\right)^2} \mathbb{V}(S_n) \stackrel{??}{\leq} \frac{1}{\varepsilon^2 \sum_{j=1}^n \mathbb{P}(A_j)} \xrightarrow[n \rightarrow \infty]{} 0. \end{aligned}$$

Por tanto, $\frac{\sum_{j=1}^{\infty} \mathbb{1}_{A_j}}{\sum_{j=1}^{\infty} \mathbb{P}(A_j)} \xrightarrow[n \rightarrow \infty]{\mathbb{P}} 1$.

Definimos $\forall k \in \mathbb{N} : n_k := \min \{n : \mathbb{E}[S_n] \geq k^2\}$ y $T_k := S_{n_k}$, entonces, $k^2 \leq \mathbb{E}[T_k] \leq k^2 + 1$.

$$\implies \mathbb{P}\left(\underbrace{\{|T_k \cdot \mathbb{E}[T_k]| > \varepsilon \mathbb{E}[T_k]\}}_{A_k^\varepsilon}\right) \leq \frac{1}{\varepsilon^2 k^2}.$$

$$\implies \sum_{k=1}^{\infty} \mathbb{P}(A_k^\varepsilon) \leq \frac{1}{\varepsilon^2} \sum_{k=1}^{\infty} \frac{1}{k^2} < \infty \xrightarrow[\text{B-C I}]{\downarrow} \mathbb{P}\left(\limsup_{k \rightarrow \infty} A_k^\varepsilon\right) = 0.$$

Por el argumento de la demostración de la convergencia-probabilidad-imp-subsucesion-casi-segur

$\frac{T_k}{\mathbb{E}[T_k]} \xrightarrow[k \rightarrow \infty]{c.s.} 1$. Sea n tal que $n_k \leq n \leq n_{k+1}$, entonces

$$\frac{T_k}{\mathbb{E}[T_{k+1}]} \leq \frac{S_n}{\mathbb{E}[S_n]} \leq \frac{T_{k+1}}{\mathbb{E}[T_k]}$$

y basta probar que (a) $\frac{T_k}{\mathbb{E}[T_{k+1}]} \xrightarrow[k \rightarrow \infty]{c.s.} 1$ y (b) $\frac{T_{k+1}}{\mathbb{E}[T_k]} \xrightarrow[k \rightarrow \infty]{c.s.} 1$.

(a) Sea $\omega \in \Omega$ tal que $\frac{T_k(\omega)}{\mathbb{E}[T_k]} \xrightarrow{k \rightarrow \infty} 1 \implies \frac{T_k(\omega)}{\mathbb{E}[T_{k+1}]} = \frac{T_k(\omega)}{\mathbb{E}[T_k]} \cdot \frac{\mathbb{E}[T_k]}{\mathbb{E}[T_{k+1}]}$ y además

$$\frac{k^2}{(k+1)^2 + 1} \leq \frac{\mathbb{E}[T_k]}{\mathbb{E}[T_{k+1}]} \leq \frac{k^2 + 1}{(k+1)^2}$$

con cada uno de estos términos tendiendo a 1. Por tanto, $\frac{T_k}{\mathbb{E}[T_{k+1}]} \xrightarrow[k \rightarrow \infty]{c.s.} 1$.

(b) Se hace de forma análoga.

Como $\frac{T_k}{\mathbb{E}[T_{k+1}]} \leq \frac{S_n}{\mathbb{E}[S_n]} \leq \frac{T_{k+1}}{\mathbb{E}[T_k]}$, entonces $\frac{S_n}{\mathbb{E}[S_n]} \xrightarrow[n \rightarrow \infty]{c.s.} 1$. ■

Temporary page!

L^AT_EX was unable to guess the total number of pages correctly. As there was some unprocessed data that should have been added to the final page this extra page has been added to receive it.

If you rerun the document (without altering it) this surplus page will go away, because L^AT_EX now knows how many pages to expect for this document.
