

Propiedad de la convolución para exponentes conjugados

Proposición 1. Sean $f \in \mathcal{L}^p(\mathbb{R}^n)$, $g \in \mathcal{L}^q(\mathbb{R}^n)$ con $p, q \in [1, \infty]$ conjugados, entonces

- (1) $f * g \in \mathcal{L}^\infty(\mathbb{R}^n)$ y $\|f * g\|_\infty \leq \|f\|_p \|g\|_q$.
- (2) $f * g$ es uniformemente continua en $\mathbb{R}^n$.

Demostración:

- (1) Aplicando la desigualdad de Hölder a la definición de convolución, tenemos que

$$|f * g(x)| = \left| \int_{\mathbb{R}^n} f(x-y) g(y) dy \right| \leq \int_{\mathbb{R}^n} |f(x-y)| |g(y)| dy \leq \|f\|_p \|g\|_q.$$

Por tanto, $\|f * g\|_\infty \leq \|f\|_p \|g\|_q$.

- (2) Definimos $\tilde{f}(x) := f(-x)$ y consideramos $p \in [1, \infty)$. Por el `lem-convergencia-lp-traslacion/Lem` dado $\varepsilon > 0$, existe $\delta > 0 : \forall h \in B(0, \delta) : \left\| T_h \tilde{f} - \tilde{f} \right\|_p < \frac{\varepsilon}{\|g\|_q}$. Sean $a, b \in \mathbb{R}^n$ tales que $\|a - b\| < \delta$, entonces

$$\begin{aligned} |f * g(b) - f * g(a)| &= \left| \int_{\mathbb{R}^n} (f(b-y) - f(a-y)) g(y) dy \right| \\ &\leq \int_{\mathbb{R}^n} |T_b \tilde{f}(y) - T_a \tilde{f}(y)| |g(y)| dy \\ &\stackrel{\text{Hölder}}{\leq} \left(\int_{\mathbb{R}^n} |T_b \tilde{f}(y) - T_a \tilde{f}(y)|^p dy \right)^{\frac{1}{p}} \|g\|_q \\ &= \left(\int_{\mathbb{R}^n} |T_a (T_{b-a} \tilde{f} - \tilde{f})(y)|^p dy \right)^{\frac{1}{p}} \|g\|_q \leq \frac{\varepsilon}{\|g\|_q} \|g\|_q = \varepsilon. \quad \blacksquare \end{aligned}$$

Temporary page!

L^AT_EX was unable to guess the total number of pages correctly. As there was some unprocessed data that should have been added to the final page this extra page has been added to receive it.

If you rerun the document (without altering it) this surplus page will go away, because L^AT_EX now knows how many pages to expect for this document.
