

Equivalencia entre densidad y complemento con interior vacío

Proposición 1. Sea $(X, \mathcal{T})$ un espacio topológico y $D \subset X$ un subconjunto, entonces

$$D \text{ es denso en } X \iff D^c \text{ tiene interior vacío.}$$

Demostración: Veamos directamente la equivalencia por definición de interior:

$$\begin{aligned} \text{Int}(D^c) = \emptyset &\iff \neg(\exists x \in X : \exists U \in \mathcal{V}(x) : U \subset D^c) \iff \forall x \in X : \forall U \in \mathcal{V}(x) : U \not\subset D^c \\ &\iff \forall x \in X : \forall U \in \mathcal{V}(x) : U \cap D \neq \emptyset \iff \forall U \in \mathcal{T} \setminus \{\emptyset\} : U \cap D \neq \emptyset, \end{aligned}$$

pero lo la prop-con-denso/??, esto es equivalente a que D sea denso en X . ■

Temporary page!

L^AT_EX was unable to guess the total number of pages correctly. As there was some unprocessed data that should have been added to the final page this extra page has been added to receive it.

If you rerun the document (without altering it) this surplus page will go away, because L^AT_EX now knows how many pages to expect for this document.
