

title

Corolario 1. Sean f, g antiholomorfas en Ω_1 y Ω_2 respectivamente con $f(\Omega_1) \subset \Omega_2$. Entonces,

$$\forall z \in \Omega_1 : \quad \frac{\partial}{\partial z}(g \circ f)(z) = \frac{\partial g}{\partial \bar{z}}(f(z)) \frac{\partial \bar{f}}{\partial z}(z) \quad \wedge \quad \frac{\partial}{\partial \bar{z}}(g \circ f)(z) = 0.$$

En particular, $g \circ f$ es holomorfa en Ω_1 .
