

Ecuación en derivadas parciales

Definición 1 (Ecuación en derivadas parciales). Una ecuación en derivadas parciales (EDP) es una ecuación funcional de la forma:

$$F(x_1, x_2, \dots, x_n, u_{x_1}, u_{x_2}, \dots, u_{x_n}, u_{x_1 x_2}, \dots) = 0 \quad (1)$$

donde $x = (x_1, x_2, \dots, x_n) \in \Omega \subset \mathbb{R}^n$ abierto y $u: \Omega \rightarrow \mathbb{R}$ es la función incógnita.

Las variables $u_{x_{i_1} \dots x_{i_k}}$ denotan $\frac{\partial^k u}{\partial x_{i_1} \dots \partial x_{i_k}}$ y $F: \Omega \times \mathbb{R} \times \mathbb{R}^n \times \dots \rightarrow \mathbb{R}$ es una función dada con un número finito de variables.

Temporary page!

L^AT_EX was unable to guess the total number of pages correctly. As there was some unprocessed data that should have been added to the final page this extra page has been added to receive it.

If you rerun the document (without altering it) this surplus page will go away, because L^AT_EX now knows how many pages to expect for this document.
